

HP OCR + BARCODE

Font base modul

User Guide and Programming Manual

Revision 1.6a

- sos8026F: Incl. 10 MB permanent flash memory for all HP LaserJet series 2420, 2430, 4250, 4350, 9050 Colour LaserJet 4650, 5500*
- sos8026D: For all HP LaserJet series 2100, 4000, 4050, 4100, 4200, 4300, 5000, 5100, 8000, 8100, 8150, 9000, 9055, 9065 including mfp versions Color LaserJet 2500, 3700, 4500, 4550, 4600, 5500 and 9500, Business InkJet 3000*
- sos8026C: For all HP LaserJet series 8500 and 8550*
- sos8026L: For all HP LaserJet series 1200, 1220, 1300, 1320, 2200, 2300, 3200, 3300, 3320, 3330, 3380mfp Colour LaserJet 2550*
- sos8026S: For all HP LaserJet Series 4, 5 and 6 except L-Versionen, Color LaserJet, (Enhanced) Color LaserJet 5, CopyJet and all DeskJet Series 1200 and 1600*

Introduction

Thank you for purchasing the sos8026 font based OCR and Barcode product. This modul do enhance the supported HP printers to print:

- OCR-A1 for check and bank transmission forms printing
- OCR-B as machine readable type
- Symbols like green point, recycling and much more
- Barcodes for data recognition
- A macro for testing of build in printable forms
- and in the F-Version up to 10 MB flash memory for storing forms, logos, etc.

The font based implementation requires, that the calculation of necessary check digits or the „Interleaving“ of the barcodes „2of5 interleaved“ and „Deutsche Post AG“ has to be done by the application software. An intelligent printer or pure software based product is also available: www.stethos.com/e_welp.hgtm or www.stethos.com/e_jetmobile.htm.

The sos8026S Font-SIMM, sos8026D Font-DIMM or the sos8026F Memory-Flash-Card contains with the exception of the Letter Gothic all fonts of the HP Font-Cartridge „Bar Codes & More“, part number „C2053A #C06“. The Letter Gothic fonts are already implemented in the printer in scaling technology. For this reason the fonts were not added to the product. The OCR fonts do print characters like German „Umlaute“ and the „§“ sign.

The product is CE- and low voltage certified.

This package does contain:

- sos8026S Font-SIMM, or
sos8026D Font-DIMM or
sos8026F Memory-Flash-Card (MFC)
- English documentation

The floppy disk with drivers examples and electronic manuals is not anymore part of the product shipment. It can be downloaded at www.stethos.com/e_sos8026.htm following the support ink: driver.

Installation

WARNING For installation please follow the SIMM/DIMM/MFC installation advises in the printer's User Reference Manual. Especially follow all instructions to reduce the risk of damage the device by static electricity.

Installation Notes

The printer compatibility list can be found on the first page of this document.

Please switch off the power from the device before opening it.

The **SIMM or DIMM** board can be plugged into any free slot. For installation please follow carefully the advises in the printer's User Reference Manual. Noses on the board prevent from plugging the module in the wrong way.

The **MemoryFlashCard (MFC)** go into any slot of the printer. The card must move easily without any needed power into the slot. Otherwise you may plug it in the wrong way. The module usually will survive, if plugged in the wrong way.

Under some circumstances, the printer may erase the flash card, after the printer is powered on the first time. The developers had the choice to run the module in ROM or in flash version. It was decided to for the benefit of the flash part, as it gains the possibility to update and to put forms, fonts, signatures, logos etc on the product.

If there are no barcode fonts listed on the PCL font list, nor the file directory does not list a subdirectory FIRMWARE in the root, then please contact stethos. You may find the address on the last page of this booklet. You will simply receive an update file, which has to be copied to the printer.

Testing the Installation

The generation of the **PCL Font List** at your printer confirms the proper installation of the SIMM / DIMM board or the MC module. The necessary steps are explained very detailed in the printer's User Reference Manual.

NOTE The PCL Font List doesn't print readable barcode. The printer documents only the available fonts and their ESC sequences.

Are the fonts not available on the sos8026F Memory-Flash-Card, they seem to be erased during the first time power on of the printer. It is possible to download the fonts again. Please read the last chapters of the previous page..

PCL is the shortage for **Printer Command Language** which is the name of the printer access language developed by HP. Further detailed documentation for any PCL command is published by HP in the manual „PCL5 printer language technical reference manual“.

A quick additional test for correct installation is to print the file **8026TEST.TXT** from the driver and support download, which can be found at www.stethos.com/e_sos8026.htm and follow the drivers link.

Therefor the MS DOS-Command could be like this:

```
COPY /B A:\8026TEST.TXT LPT1
```

The dowbload also contains for each font and barcode comprehensive test files, see subdirectory **TEST8026**. The following command does print all files to the printer device LPT1:

```
COPY /B A:\TEST8026\*.* LPT1
```

All files in this directory do generate for each type of font a printout with all available characters. The barcodes are readable with any proper device.

Driver

All not scaleable (also named „**bitmapped**“) fonts (OCR-A1, OCR-B, Code EAN and 39) are the original fonts out of the cartridge „Bar Codes & More“, HP part number „**C2053A #C06**“ or out of the previous versions „**92286-X**“ and „**92286-W1**“.

The sos8026 modules are with some restrictions also usable in Microsoft Windows. The self extracting WEB download driver file at www.stethos.com/e_sos8026.htm - driver link, do contain two description files (*.PCM) which add the new functionality to the standard HP printer drivers.

This method does only add printer fonts and no screen fonts. That's why there are no lines displayed on screen. The printout of barcodes without „interleaving“ and without check digits is easily possible.

Windows 3.x Open the Control Panel and select the printer, then Settings and Printer Settings. Select Fonts, New, Add, select the directory, and copy the two description files to the left window. After exiting the font installation window, both „modules“ are displayed at the very end of the cartridges/SIMM/DIMM selection list box. Activate the requested module(s).

Windows 95 The installation is quite similar to Windows 3.x. Just in case the systems doesn't recognize the description files, install the Windows 3.x printer driver.

Windows NT The driver download zip file from www.stethos.com/e_sos8026.htm does also contain a LaserJet printer driver developed by HP. See the readme file in the directory WIN_NT for further information.

Windows 2000,XP: Is currently not supported. But could work, depending on the used drivers. Try to install old LJ 4 drivers wither form HP or Microsoft.

MS Word The driver download also contains a Microsoft Word Macro for barcode and mail merge printing, see subdirectory WINWORD. The macro also contains in „Basic“ for all barcodes the routines for interleaving and check digits.

NOTE: If you need to enter any character above 127 via the keyboard, you need to add a zero in front of the ASCII value, like Alt+0129. Also the characters above 127 are repeated at position 200.

Introducing the World of Barcodes

General Remarks

Barcodes do influence our daily business very much. In deed, each product in the food stores is labeled with the EAN barcode. This unique mark helps for inventory and detailed customers bills.

Other barcodes do help to minimize the letter and package delivery time, and in case of being lost, the system does know where the part was at least recognized.

The following list explains the major benefits and disadvantages of the different barcode types:

Alphanumerically Barcodes

Code 39 (also 3of9) + Easy construction, reliable readable
 + Possibly most used code
 + Self proofing, even without check digits
 + Additional check digit possible
 + US-ASCII Table can be coded
 - Needs a lot of space

Code 93 Pretty similar to Code 39, needs less space.

Code 128 + US-ASCII Table can be coded
 + Compression routine for numeric contents
 + No reading failure because of check digit
 - Complex Usage

UCC 128 Similar to Code 128, with an additional control sign

EAN 128 Similar to Code 128, with an additional control sign

Numeric Barcodes

UPC/EAN + High Information on few space
 + Readable up to an angle of 45 degrees
 + No reading failure because of check digit
 - Only 8 or 13 digits
 - Very tiny tolerances

Code 2of5 matrix, Code 2of5 industrial, Codabar	+ High tolerances + Additional check digit possible
Code 2/5 interleaved	+ Very high information on very few space + Additional check digit possible - Tiny tolerance
MSI	+ Additional check digit possible + High tolerances - Needs lots of Space

Construction of the Codes

Each barcode do start with a **guard bar** (start character), followed by the **message**, and the **check digit** (if requested or necessary) and ends with **another guard bar** (stop character). Some types of barcodes do have the same start and stop character.

Around the printed barcode is mostly requested a **space zone** (not printed area). This zone is either defined by the reading application or part of the specification of the barcodes reading system. Usually about 5 to 6 mm space should be enough.

Some types of barcode can be used in different modes:

- With and without check digit
- Different proportions (see next chapter)
- Expansion for upper- and lower case characters
- With and without readable text

As explained, some of the codes do have the possibility to add an optional check digit. Those sign is always represented by a regular character out of the barcode character set. If the reading device is not programmed for proof checking the **optional check digit** is mostly treated as a regular „message“ sign.

Readability

Within certain tolerances the statement, that the bigger (wider) the code the better the readability, is quite true. Some barcodes do quite good in printing a lot of information on a small space, like for example Code 2of5 interleaved or Code 128 C.

Some type of barcodes can be used with different **proportions**, also known as **module width**. This width is defined by the smallest bar/space. A proportion of 1:3 claims, that the next thicker bar/ space is three times wider then the smallest one. Of course a code with module width 1:3 compared to 1:2 needs more printing space, but on the other hand proportion 1:3 is easier readable.

NOTE	Mostly very thin bars are printed a little big more bold than they should be. This is not very helpful for the readability of the code, but can be compensated by reducing the toner density .
------	---

On some printers, a slight degradation of image quality may occur immediately after replacing the toner cartridge. To assure that the barcode images are printed for later reading with sufficient quality, follow these instructions:

- Be certain that the storage and care instructions for toner cartridge had been fulfilled.
- Be sure to change the EP cartridge when necessary. Carefully follow the installation instructions.
- Check on regular bases the print quality through the first 50 pages.

The used **Paper** or **transparency Film** do have a major influence on the later readability of the barcode. The basic paper color should provide a good **contrast** to the toner color. Rub with your finger nails on the paper, the tone should not take off.

In order to print barcodes with a small module width, please use printer with a higher resolution (600 dpi).

Programming Conventions

In the following some characters are shown in **Decimal Form**. These values are always surrounded by smaller and greater as signs, some examples are:

- <27> defines the ESC character, or hexadecimal 0x1b.
- <65> is defined in the ASCII Table as characters A, or hex 0x41

Tips and Restrictions

- The differentiation of the character ‘O’ and the number ‘0’ is sometimes in the control sequences (**ESC-Sequence**) not very clear. On the print out of the PCL Font List each zero is marked with an additional slash.
- Does the printer driver of your software allow for additional fonts only to enter a selection and a de-selection sequence, please note the following:
Because of the font technology of the product, there might be no way to access any type of barcode with „interleaving“ and/or check digits (for example like **SAP R/2 and R/3 and KHK DOS-Software**).
For those applications we do recommend the intelligent JetMobile BarSIMM/DIMM/MFC www.stethos.com/e_jetmobile.htm or the software emulation www.stethos.com/e_welp.htm.
- An interleaving and check digit example for all type of barcodes can be found in MS Word „basic“ on the extracted driver download file from www.stethos.com/e_sos8026.htm.
- The sos8026 font based modules and the JetMobile BarDIMM do only support the printer language PCL.
- If you are not familiar to the barcode technology, it is recommended to start with the Code 39. In the beginning you shouldn’t use any special sign and also try avoid the space character. Just reduce the message information to upper case characters and numbers, and frame it with the multiplication sign like:

TEST4711

results in

Cursor positioning

In order to move the cursor on the printers page, PCL offers three different possibilities. One of the those methods depend on the actual resolution (300/600 dpi), another on the actual used font. Therefore we do recommend to use the only positioning command, which is fully independent of any actual printer setting:

<27>&a###H (Horizontal) and <27>&a###V (Vertical)

The value ### is measured in 1/720 Inch (=2.54cm). The decimal sign is the point. As an example <27>&a566.9h1133.86V positions the cursor about 2 cm of the left and 4 cm of the top **printing origin**.

Note	The printing origin depends upon the hardware restrictions of the print engine. For HP laser printer the printing origin is about 6 mm from top and left of the physical page.
------	--

A plus or minus sign in front of the positioning value causes the printer to perform at the actual cursor position a **relative movement**. For example <27>&a-720V positions the cursor 1 inch towards the top of page.

Note	If two followed ESC-Sequences do have the same first three characters, the last character of the first sequence could be written in lower case, and the next three characters can be eliminated.
------	--

Don't change the printing position

PCL is able to store any cursor position, reposition the cursor and return to the initial position.

<27>&fS (**Push Cursor**)

.... any PCL statement including cursor positioning ...

<27>&f1S (**Pop Cursor**)

Selection of Barcodes and Fonts

Printing barcode is equivalent to change to any other font. This requires at least three different steps: The ESC-Sequence for **addressing** the font, the **message** itself and the selection of the **follow-up font**. For example:

Selection of Code 39 20pt	<27>(10Q<27>(s1p20v0s0b10004T
Message information	*12345*
Standard Courier 10pt	<27>(10U<27>(s0p10h12v0s0b4099T

The necessary PCL sequences for barcode and standard build in font selection are listed in the PCL Font List.

An easier and faster way to select any font is to use the **primary** and **secondary** font set.

PCL allows to define two font sets at the „same“ time. Secondary fonts are defined with the same ESC Sequence, but instead of the opening the closing ‘)’ parenthesis has to be used. In order to switch between the sets, use **Shift-Out** <14> for the secondary and **Shift-In** <15> to return to the primary setting.

The advantage of this method is to keep the definition of the primary font. An example:

Code 39 as secondary	<27>)10Q<27>)s1p12vsb10004T
Standard font as primary	<27>(10U<27>(s0p10h12vsb4099T
Printout: Part No	<14>*12345*<15> Storage <14> *4711* <15>

Part No  Storage 

First complete Example

The file EXAMPLE1.TXT in the main directory of the on the extracted driver download file from www.stethos.com/-e_sos8026.htm does print a slightly different example. This file can be loaded and printed with any ASCII Editor like for example the DOS Editor EDIT.

... normal printing data	
<27>&fS	Save the original printing position
<27>&a####h####V	Set the barcode printing position
<27>)10Q<27>)a1p20vsb10004T	Select code 39, secondary font set
<14>	Activate the secondary font set
12345	Message, including start-stop-signs
<15>	Return to the primary font set
<27>&f1S	Return to original print position
further printing data ...	
<12>	Form feed.

NOTE The single ESC-Sequences in the description above have to be entered all in one flow, and not row by row. Any CR-LF influences the positioning of the printer cursor!

A small trick is necessary to enter with the DOS editor EDIT special characters like <27>, <14> and <15>. First press the combination for keyboard entry: Strg-P, than hold down the ALT-key and enter the ASCII number on the right number pad of your keyboard.

Rotate for 90 degrees

In order to rotate the barcode or any other font to 90 or 240 degrees, PCL offers the sequences <27>&a90P and <27>&a240P.

The printer needs to receive <27>&aP to return to the normal printing direction.

The file EXAMPLE2.TXT on the driver download file from www.stethos.com prints an example.

Enlarging the Barcode

The next example demonstrates one way to enlarge a barcode by printing the same code twice, but at a moved up/down position.

```
<27>)10Q<27>)a1p20vsb10000T
```

Select code 39, secondary font set

... normal printing data

```
<27>&fS
```

Save the original printing position

```
<27>&a####h####V
```

Set the barcode printing position

```
<14>
```

Activate the secondary font set

```
<27>&fS
```

Save the barcode printing origin

```
<27>&a-##V
```

Move the printing position up

```
*12345*
```

Message, including start-stop-signs

```
<27>&f1S
```

Return to the barcode printing origin

In order to even further enlarge the barcode you may restart the loop at „Save the barcode printing origin“ and move the printing position further up.

```
*12345*
```

Message, including start-stop-signs for the lowest strip

```
<15>
```

Return to the primary font set

```
<27>&f1S
```

Return to original print position

further printing data ...

NOTE

If you would like to get readable text below the barcode, change before printing the last strip to the font with readable text.

The file EXAMPLE3.TXT on the driver download from www.stethos.com/-d_sos8026.htm prints an example.

Please keep in mind, that the most important barcodes are implemented into the sos8026 product in four different sizes.

Reduce the barcode size using PCL

This example demonstrates how to reduce the size of the barcode. This is only necessary if the code is already too tall at it's needed width:

<27>)10Q<27>)a1p20vsb10004T

Select code 39, secondary font set

... normal printing data

<27>&fS

Save the original printing position

<27>&a###h####V

Set the barcode printing position

<14>

Activate the secondary font set

<27>&fS

Save the barcode printing origin

12345

Message, including start-stop-signs

<27>&f1S

Return to the barcode printing origin

<15>

Return to the primary font set

<27>&a-##V

Move printing position to top of barcode

<27>*c###h##v1P

Print a white rectangular, ### in 1/720 Inch.

<27>&f1S

Return to original print position

further printing data ...

NOTE

If the printed barcode is so large, that it is already printing in the upper text, just set the barcode printing position lower. In this case you have to cut the bottom part of the code.

The file EXAMPLE4.TXT on the driver download from www.stethos.com/-d_sos8026.htm prints an example.

Independent scaling of Barcode width and height

HP-GL/2 is able to print any scaleable PCL font (not the „bitmapped“ fonts out of the „Bar Codes & More“) in any user defined width/height ratio. Therefore you need only one ESC sequence to print the code.

NOTE The new HP Laser printer are only able to scale the Y direction.
This means you should set in PCL the font already to the requested X width.

<27>&fS	Save the original printing position
<27>&a#####V	Set the barcode printing position
<14>	Activate the secondary font set
<27>*c28D	Definition of a new font ID: 28
<27>)10Q<27>)s1p20vsb10004T	Select code 39, secondary font set
<27>*c6F	Assign the font to ID 28
<15>	Return to the primary font set
<27>%1BSP1;SA;FN28;	Start HP-GL/2, keep the PCL printing position, use Pen 1, secondary font set and font ID 28
AD1,341	Choose again 10Q for symbol set
DT#;	Definition of the character '#' as end of text. Is this sign used in your message data, take any other unused character, Like ?.
SI###,###;	Define the new width and height in cm of the font, for example SI1,5,5;
LB*12345*#;	Prints the message with the LB command, ended by the '#' sign
<27>%0A	Return to PCL
<27>&f1S	Return to original print position

The file EXAMPLE5.TXT on the driver download from www.stethos.com/-d_sos8026.htm prints an example.

<27>(0Y<27>(s0p4.6h12v0s0b0T	of „Bar Codes & More“	

Font size in point

* 0->3 different Height/Width relations.

Valid characters

01-89 AB-YZ \$ % + - . / space

PCL is unfortunately not able to print the space sign (it just performs a cursor movement). The scaleable fonts do have the space mapped to character '@' (<64>) and the bitmapped fonts to the comma sign.

The Code with the proportion 1:2 and readable text do have the start-/stop sign also on the characters '(' and ')'. However, both characters do not print the '*' sign below. The bar length of the closing parenthesis are even longer then the other ones, so the readable message text looks like embedded.

Usage

The message has to be embedded between the start-/stop bar '*' <42>. The recommended minimum barcode height is 20 mm or 25% of the width. The amount of message characters is only limited by capabilities of the reading device.

Check digit (Optional)

The type of character coding already enables the reader to verify the read information. However, on request there can be added a **check digit** right after the message information and before the stop bar.

In order to calculate the check digit each message character is related with a unique **reference number**: 0-9 gets 0-9, A-Z gets 10-35, minus 36, point 37, space 38, dollar sign 39, slash 40, plus 41 and percentage 42. The start-/stop sign is not referenced. The check digit is finally calculated **modulo 43** out of the sum of the reference numbers.

Example: CODE12 results in *CODE12N*
 $12+24+13+14+1+2 = 66 / 43 = 1 \text{ Rest } 23 = N$

Example

'66789 ER' proportion 1:2 and readable text

<14><27>)10Q<27>)s1p20vsb10005T*66789@ER*<15>

PZN Pharma-Central-Number

Usage

This code is based upon the Code 39. In addition a minus sign '-' has to follow direct after the start bar. The message length is fixed to six digits, followed by a check digit and the regular code 39 stop bar.

The code should be used with proportion 1:3. For module width larger then 0,5 mm the proportion 1:2 is recommended.

The minimum code size is 6 mm.

Check digit

Each of the six message numbers has to be multiplied with it's position plus 1. The check digit is calculated **modulo 11** out of the multiplication sum. Any PZN number, whose check digit would be 10 is not handed out.

Example

123456

Check digit: $2+6+12+20+30+42 = 112 / 11 = 10 \text{ Rest } 2$
 <14><27>)0Y<27>)sp4.6h12vsbT*-1234562*<15>

CODE-39 extended

The **usage** and **calculation** of the optional **check digit** is identical to the code 39. Even the range of valid characters are the same.

In addition the full **US-ASCII** table can be coded by setting in front of every character an additional control character: \$, %, / or +.

ASCII	39 ext						
NUL	%U	DC2	\$R	\$	/D	?	%J
SOH	\$A	DC3	\$S	%	/E	@,\$	%V
STX	\$B	DC4	\$T	&	/F	A..Z	A-Z
ETX	\$C	NAK	\$U	'	/G	[,Ä	%K
EOT	\$D	SYN	\$V	(/H	\,Ö	%L
ENQ	\$E	ETB	\$W)	/I] ,Ü	%M
ACK	\$F	CAN	\$X	*	/J	^	%N
BEL	\$G	EM	\$Y	+	/K	_	%O
BS	\$H	SUB	\$Z	,	/L	`	%W
HT	\$I	ESC	%A	-	/M	a..z	+A .. +Z
LF	\$J	FS	%B	.	/N	{,ä	%P
VT	\$K	GS	%C	/	/O	\,ö	%Q

SI	\$O	!	/A	<	%G		
DLE	\$P	..	/B	=	%H		
DC1	\$Q	#	/C	>	%I		

NOTE To recognize the Codes 39 extended, your reader usually must be set to this code. Otherwise it may return the control signs as pure message information.

Example

h-p proportion 1:3 no check digit

<14><27>)10Q<27>)s1p12vsb10001T*+H/M+P*<15>

CODE-93

ESC-Sequences

<27>(10Q<27>(s1p###v0s0b10250T

no readable text

<27>(10Q<27>(s1p###v0s0b10251T

readable text

Font size in point

Valid characters

Numbers 01..89, upper case characters A-Z, special signs \$%+-. / space @ <64>.

Usage

The start bar, opening parenthesis ‘(’, is followed by message, two check digits and the stop bar, closing parenthesis ‘)’.

Check digits

The Code 93 needs 2 check digits. The first one is calculated out of the sum of the multiplication from right to left of each reference value with its position number. After each 20th position, the multiplication factor is reset to 1. Finally the reference value of the first check digit is calculated out of the sum by **modulo 47**.

The second check digit follows the same algorithm. The first check digit is already multiplied with position 1, and the multiplication factor is reset after each 15th character to 1.

The reference values of the message characters are:

Val.	Ref.	Val.	Ref.	Val.	Ref.	Value	Ref.	Value	Ref.
0	0	A	10	K	20	U	30	/	40
1	1	B	11	L	21	V	31	+	41
2	2	C	12	M	22	W	32	%	42
3	3	D	13	N	23	X	33		
4	4	E	14	O	24	Y	34		
5	5	F	15	P	25	Z	35		
6	6	G	16	Q	26	-	36	a	43
7	7	H	17	R	27	.	37	b	44
8	8	I	18	S	28	Space	38	l	45
9	9	J	19	T	29	\$	39	h	46

Example for character calculation: CODE 93

1. Example:

$$3 + 2*9 + 3*38 + 4*14 + 5*13 + 6*24 + 7*12 = 484$$

$$484 \text{ Modulo } 47 = 10 \text{ rest } 14 \Rightarrow \text{ASCII E}$$

2. Example:

$$14 + 2*3 + 3*9 + 4*38 + 5*14 + 6*13 + 7*24 + 8*12 = 611$$

$$611 \text{ Modulo } 47 = 13 \text{ rest } 0 \Rightarrow \text{ASCII 0}$$

Example

CODE 93

<14><27>)10Q<27>)s1p12vsb10251T(CODE@93E0)<15>

CODE-93 extended**ESC-Sequences**

Identical to code 93.

Valid characters

Identical to code 93, additional control characters 'a', 'b', 'h' and 'l'.

Usage

In order to handle with the same valid characters like Code 93 the full ASCII character set there is a two byte coding necessary. In front of each character there must be printed on of the following control characters 'a', 'b', 'h' or 'l':

Val.	Codi.	Val.	Codi.	Val.	Coding	Val.	Coding
NUL	bU	DC2	aR	\$	ID	?	bJ
SOH	aA	DC3	aS	%	IE	@, \$	bV
STX	aB	DC4	aT	&	IF	A..Z	A-Z
ETX	aC	NAK	aU	'	IG	[, Ä	bK
EOT	aD	SYN	aV	(IH	\, Ö	bL
ENQ	aE	ETB	aW)	II] , Ü	bM
ACK	aF	CAN	aX	*	IJ	^	bN
BEL	aG	EM	aY	+	IK or +	_	bO
BS	aH	SUB	aZ	,	IL	`	bW
HT	aI	ESC	bA	-	IM oder -	a..z	hA .. hZ
LF	aJ	FS	bB	.	IN or .	{, ä	bP
VT	aK	GS	bC	/	IO od /	\, ö	bQ
FF	aL	RS	bD	0..9	IP..IY or 0.9	}, ü	bR
CR	aM	US	bE	:	LZ	~, ß	bS
So	aN	SP	space	;	bF	DEL	bT
SI	aO	!	lA	<	bG		
DLE	aP	„	lB	=	bH		
DC1	aQ	#	lC	>	bI		

Example

Code 93

<14><27>)10Q<27>)s1p12vsb10251T(ChOhDhE@93a8)<15>

Codabar

ESC-Sequences

<27>(10Q<27>(s1p###vsb10002T no readable text
 <27>(10Q<27>(s1p###vsb15007T readable text
 ### Font size in point

Valid characters

01..89 \$ + - . / :

Usage

According to the application, the Start-/Stop signs can be used out of the following character range: 'A', 'B', 'C' or 'D'.

Example

6789012 
 <14><27>)10Q<27>)s1p20vsb15007TA6789012B<15>

AIM Codabar

The AIM codabar does need an additional check digit in front of the stop bar.

Check digit

The numbers 0-9 do get the **reference value** 0-9, minus 10, dollar sign 11, colon 12, slash 13, point 14, plus sign 15 and start- stop signs A-D 16-19.

The check number is calculated through the addition of the reference values of all bars, including start and stop. The final number is the difference to the next 16th multiplier.

Example:	Message information	A01234B
	Sum of the reference values	16+0+1+2+3+4+17 = 43
	check digit algorithm	3 * 16 = 48 - 43 = 5
	printing information	A012345B

Further information is available at AIM USA, 634 Alpha Drive, Pittsburgh, PA 15238-2802, USA, phone (412) 963-8588, fax (412) 963-8753.

2of5 interleaved

ESC-Sequences (not supported in Color LJ 8500 and 8550)

<27>(10Q<27>(s1p###v0s0b13000T	no readable text	V1:3
<27>(10Q<27>(s1p###v0s0b13100T	no readable text	V1:3

<27>(10Q<27>(s1p###v0s0b13011T	readable text	V1:2.5
<27>(10Q<27>(s1p###v0s*b13010T	no readable text	V1:2
<27>(10Q<27>(s1p###v0s0b13011T	readable text	V1:2

Font size in point

* 0->3 different Height/Width relations.

Valid characters

Numeric numbers 0-9

Usage

Using the interleaving method for printing digits, the code is very compact. Therefore always two digits are coded at a time. The first digit is represented by the bar lines, the second by the spaces.

Start sign '#', stop sign '\$'

The number of message characters including optional check digit is always even. In order to print the code 2of5 interleaved you have to add a small calculation routine to your application. Each pair of numbers is printed directly as one character using this is the algorithm:

$$\text{Value first digit} * 10 + \text{Value second digit} + 40.$$

Examples: Number 12 results in $1*10+2+40 = 52 = \text{number '4'}$
 Number 57 results in $5*10+7+40 = 97 = \text{character 'a'}$

Check digit (optional)

Sum all values of the odd positioned digits beginning with position 1. Multiply the result by 3 and add the values of the even digits.

The check digit is calculated out of the subtraction to the next by 10 dividable number (modulo).

Example: message information 1632534 needs check digit 0

$$(1+3+5+4) * 3 + 6 + 2 + 3 = 50 + 0 = 50$$

Notes

The driver download from www.stethos.com/-d_sos8026.htm contains detailed **examples** including some **C source** code for printing code 2of5 interleaved. The following C code shows the minimum routine:

```
void Barcode2of5interl(int Value)
{
    char ValStr[50];
    int i = 0;
    printf(„%c(10Q%c(s1p12vsb13001T#“, 27, 27);
    itoa(Value, ValStr, 10);
    while(i < strlen(ValStr)
    {
        char PrintCh=(ValStr[i]-‘0’)*10 + (ValStr[i+1]-‘0’)+40;
        /* PrintChar += 72; */      /* see below */
        printf(„%c“, PrintCh);
        i = i + 2;
    }
    printf(„,$“);
}
```

Some Computer Systems as e.g. AS/400 have problems to send characters above ASCII 128. The fonts with the additional name HOST, type face number 13050, 13051 (1:3); 13150 (1:3 Post) and 13052 (1:2) do print all characters starting position 91, but moved down to starting position 41. The characters above 127 are also again implemented at position 200 and above within the same master fonts.

You may switch using Shift-In and Out between both fonts.

Examples

123456 readable text without check digit (even)

<14><27>)10Q<27>)s1p10vsb13001T#<52><84><96>\$<15>

324690 readable text without check digit (even message characters)

<27>(10Q<27>(s1p10vsb13001T#<72><86><130>\$

32469085 readable text without check digit, using „host“ fonts

<27>(10Q<27>(s1p10vsb13000T<27>)10Q
<27>)s1p10vsb13050T#<72><86><14><80><75><15>\$

German Post AG

This code is based upon the 2of5 interleaved and therefor not implemented on the sos8026C product.. For differentiation to this code on the packaging materials, the German Post do calculate the check digit in a slightly different way.

ESC-Sequence

<27>(10Q<27>(s1p16.5v0s3b13020T V1:2.5
<27>(10Q<27>(s1p72v0s0b13100T V1:2

Usage

The detailed information of how to use this code is available form German Post AG in Marburg.

The „Leitcode“ does represent 13 message digits:

digits 1-5	=	Zip code
digits 6-8	=	Reference number of the street
digits 9-11	=	House number
digits 12-13	=	Product code
digit 14	=	check digit

The „Identcode“ needs 11 message digits:

digits 1-2	=	First distribution center number
digits 3-5	=	customer number
digits 6-11	=	mailing number
digit 12	=	check digit

The line with readable text has to be compiled by the software.

Check digit

The calculation uses the same algorithm as the standard 2of5 interleaved code, but the odd numbers (remember from right to left) are multiplied by 4 and the even numbers by 9.

1234567890123:

$$(1+3+5+7+9+1+3)*4 + (2+4+6+8+0+1)*9 = 64+54 = 118$$

Example

1324354657687 check digit 1

<14><27>)10Q<27>)s1p72vsb13100T#5@KVAl\$<15>

2of5 industrial

ESC-Sequences

<27>(10Q<27>(s1p###v0s0b12004T	no readable text
<27>(10Q<27>(s1p###v0s0b12005T	readable text

Font size in point

Valid characters

Numeric numbers 0..9

Usage

The start bar is coded on character 'A' or 'a', the stop bar 'B' or 'b'.
The message length is unlimited.

Check digit (Optional)

The check digit calculation uses the same algorithm as code 2aus5 interleaved, **modulo 10** with multiplier 3. The even/odd multiplier is calculated from right to left. This direction is also given for the 2of5 interleaved, but is there because of the always even number of message digits not necessary.

Example 789012 results in 7890123
 $(2+0+8) * 3 + 1 + 9 + 7 = 47 + 3 = 50$

Example

6789012 <14><27>)10Q<27>)s1p20vsb12005TA6789012B<15>

Font size in point

* 0->3 different Height/Width relations.

Valid characters

Numbers 0..9 are coded on the following 4 positions: 0..9, P..Y, p..y and as text A..J. The start-stop-middle-signs are 'b', 'e' and 'm' or 'g', 'f' and 'm'.

Usage

The code contains always one start code (**begin/g**), 6 numbers, middle sign (**middle/n**), 5 numbers, check digit and one end bar (**end/f**). If you use 'bme' then the code will look like fully embedded, 'gnf' half embedded.

EAN does code the numbers 0..9 three times, depending of the printing position. The printed number in front of the code do represent the first message digit, usually the country code. Use text printing pool A..J.

The 6 numbers after the middle sign are always taken out of number pool 2. The 6 numbers before the middle sign do represent the message numbers 2 to 7. Depending upon the first message digit, they are taken out of the number pool 0 or 1. This coding mechanism enables the reader to recalculate the first digit.

<i>First digit</i>	<i>Pos 1</i>	<i>Pos 2</i>	<i>Pos 3</i>	<i>Pos 4</i>	<i>Pos 5</i>	<i>Pos 6</i>
1	0	0	1	0	1	1
2	0	0	1	1	0	1
3	0	0	1	1	1	0
4	0	1	0	0	1	1
5	0	1	1	0	0	1
6	0	1	1	1	0	0
7	0	1	0	1	0	1
8	0	1	0	1	1	0
9	0	1	1	0	1	0
0	0	0	0	0	0	0

The pool **0** is represented by the numbers 0..9. Decimal 48 to 57

The pool **1** is represented from P..Y. Dec. 80 to 89 (Value+32)

The pool **2** is represented from p..y. Dec. 112 to 121(Value+64)

EAN 13 do code 12 message digits, but only the right eleven are printed.

For German products, country code 4 (represented by character 'E'), the digits come out of the following pools: Eb010011m222222e.

Check digit

Add all even positioned numbers, multiply the result by 3 and add all odd numbers. The check digit is calculated out of the subtraction to the next by 10 dividable number (modulo).

Example: 009623900115, check digit = 4
 $(0+6+3+0+1+5)*3 + (0+9+2+9+0+1) = 66 + 4 = 70$

Example

401234598765 check digit: 2

<27>(10Q<27>(s1p30vsb10101TEg0Q23TUnyxwvurf

EAN 8

ESC-Sequences, valid characters and check digit is according to EAN 13.

Usage

The code construction is one start code (begin/g), 4 numbers, middle sign (middle/n), 3 numbers, check digit and one end sign (end/f).

The numbers 0..9 are, compared to EAN 13, only coded in two pools. Depending on the print position, they have to be taken according to the following positioning table b0000m2222e.

The pool **0** are the numbers 0..9 themselves, Decimal 48 to 57
 The pool **2** are characters p..y, Decimal 112 to 121 (Value+64)

Example

4018273 results in check digit 5

<14><27>)10Q<27>)s1p30vsb10101Tg4018nrwsuf<15>

EAN 10mil of „Bar Codes & More“**ESC-Sequence**

Valid characters

start bar ‘(’, middle sign ‘-’, stop bar ‘(’, number pools: 0..9, A..J, a..j

Usage

See EAN 13 scaleable, but the numbers are coded in different pools.

The number pool **0** is represented by the numbers 0..9. Dec. 48 to 57

The number pool **1** is represented from a..j. Dec. 97 to 107

The number pool **2** is represented from A..J. Dec. 112 to 121

Example

001234567890

<14><27>)8Y<27>)s1p12vsbT(012345-GHIJAF(<15>

EAN 13mil from „Bar Codes & More“**ESC-Sequence**

<27>(8Y<27>(s1p12v0s3b0T

Valid characters and **Usage** see 10mil.

EAN-Velocity**Usage**

This code is similar to EAN 8, but first digit is always 0.

EAN 128

Usage (not supported in Color LJ 8500 and 8550)

This code is identical to the code 128. The control bar FC1 must be printed direct after the start bar. The check digit calculation starts with FC1 at position 1. The first message character will be multiplied with position 2.

The maximum amount of message characters is limited to 48, however, the maximum amount of printed characters is 35. This limitation includes start-, stop- and control bars.

UPC-A

ESC-Sequence see EAN-13

Usage

This code is quite similar to EAN-13, the first digit is always set to 0 and is not sent to the printer. The first 6 digits are coded out of the pool **0** and the remaining 5+1 digits after the middle sign from pool **2**. The coding of the first digit is not used. The pool positions are: b000000m222222e

Check digit

Multiply the sum of all odd positioned digits with 3 and add the remaining digits. The check digit is the value to add in order to reach the next fully by 10 dividable number.

Example: 12131415161, Check digit = 2
 $(1+1+1+1+1+1)*3 + (2 + 3 + 4 + 5 + 6) = 38 + 2 = 40$

Readable text

The following rules apply to print the codes including readable text:

1. The first sign is printed as text in front of the code, pool (A..J)
2. The check digit is printed as text direct after the stop sign, using pool (A..J)
3. The code information of the first digit and the check sum are printed in the same length as the start-, stop- and middle signs.

In order to do this, you have to switch between the fonts for non and readable text.

Example

12345678901 Check digit 2
 <27>(10Q<27>(s1p70vsb10101T Initialize readable text as primary font
 <27>)10Q<27>)s1p70vsb10100T Initialize non readable text as secondary font
 font
 B<14>b1<15>23456mwxypq<14>re<15>C

UPC-E**ESC-Sequence** see EAN-13**Valid characters**

Start bar 'b', Stop bar 'a', 0..9, A..J

Usage

This codes does represent 7 digits. The first one can be either 0 or 1 and defines the final encoding: E0 or E1.

The remaining 6 digits are coded depending upon the check digit. The pool **0** corresponds to (0..9) and **1** (P..Y).

	Coding E0						Coding E1					
CD	P2	P3	P4	P5	P6	P7	P2	P3	P4	P5	P6	P7
1	1	1	0	1	0	0	0	0	1	0	1	1
2	1	1	0	0	1	0	0	0	1	1	0	1
3	1	1	0	0	0	1	0	0	1	1	1	0
4	1	0	1	1	0	0	0	1	0	0	1	1
5	1	0	0	1	1	0	0	1	1	0	0	1
6	1	0	0	0	1	1	0	1	1	1	0	0
7	1	0	1	0	1	0	0	1	0	1	0	1
8	1	0	1	0	0	1	0	1	0	1	1	0
9	1	0	0	1	0	1	0	1	1	0	1	0
0	1	1	1	0	0	0	0	0	0	1	1	1

Check digit

In order to calculate the check digit, the barcode number has to be enlarged by some additional digits at various positions. The enlargement is in strict relation to the last digit. The table below illustrates the method:

Last digit x	Enlargement	Example 12345x
0	##00000###	1200000345
1	##10000###	1210000345
2	##20000###	1210000345
3	###00000##	1230000045
4	####00000#	1234000005
5..9	#####0000x	123450000x x = 5..9

The needed check sum is calculated as described in UPC-A.

Example: E1 789012 -> 17820000901 -> Check digit = 4
 $(1+8+0+0+9+1) * 3 + (7+2+0+0+0) = 66 + 4 = 70$

Readable text

The „coding digit“ is set ion front and the check digit after the stop bar.

Example

0876548 Check digit 2
 <14>AbXW65T8aC<15>

EAN / UPC Addon 2

ESC-Sequence see EAN-13

Valid characters

Start bar ‘c’, middle bar ‘d’, <33>..<<42>, <130>..<<139>

Usage

To be able to verify the 2 digits, they are taken out of two different pools. The pool **0** is coded <33>..<<42> and **1** <130>..<<139>. The pool usage is calculated of the remaining value of the division og the printing information by 4

Remain value	Pool for 1. digit	Pool for 2. digit
0	0	0
1	0	1
2	1	0
3	1	1

The final coding i: c#d#, where # stands for the number coming out of the various pools.

Examples

40	<14>c%d!<15>	01	<14>c!d<131><<15>
10	<14>c<131>d!<15>	03	<14>c<131>!<133><15>

EAN / UPC Addon 5**ESC-Sequence** see EAN-13**Valid signs**

Start bar 'c', sign separator 'd', <33>..<<42>, <130>..<<139>

Usage

The start bar is followed by the usage digit. The separator sign has to be inserted between each digit. Similar to 2 the digits are taken out of pool **0** <33>..<<42> and **1** <130>..<<139>. The variation of the pools is calculated out of an unprinted check sum.

CD	P1	P2	P3	P4	P5
1	1	0	1	0	0
2	1	0	0	1	0
3	1	0	0	0	1
4	0	1	1	0	0
5	0	0	1	1	0
6	0	0	0	1	1
7	0	1	0	1	0
8	0	1	0	0	1
9	0	0	1	0	1
0	1	1	0	0	0

This results into the following coding advise: #d#d#d#d#. The sign # is the user digits coming out of the via check digit calculated pools.

Check digit

All even positioned digits are added and has to be multiplied by 3. The sum of the remaining digits has to be multiplied by 9. Add both results. The check digit is the remaining value of the division by 10.

Example: 20617 Check digit = 9
 $(2 + 6 + 7) * 3 + (0 + 1) * 9 = 54$

Example

20617 <14>c<35>d<130>d<136>d<34>d<40><15>

MSI

Esc-Sequences

<27>(10Q<27>(s1p###v0s0b10750T	without readable text
<27>(10Q<27>(s1p###v0s0b10751T	with readable text
### size in point	

Valid signs

numbers 01..89

Usage

The start bar 'A' is followed by the user digits, the check sign(s) and the stop bar 'B'. The maximum length is 13 digits.

If you use readable test and Start- Stop bar 'A' and 'B' the readable text looks like embedded. Using 'a' and 'b' will print the readable text below the bars.

The calculation of the check signe is optional.

Check digit mode 1

In order to calculate the check digit generate first a new number of all even positioned digits, beginning from right hand side. Then double the number. Sum all digits from the new number and the remaining digits. The check digit results out of the difference to the next full by 10 dividable number.

Example:

Coding information	987654
New number of odd positions from right	864
Multiply by 2	1728
Add	$1+7+2+8 = 18$
Add remaining coding digits	$18+9+7+5 = 39$
Check digit	$40 - 39 = 1$

Check digit mode 2

For the two digit check sum calculate the first digit like mode 1. This first digit will be now the last number of the new coding information. Just redo the calculation according mode 1.

Check digit mode 3

For the first digit multiply all digits by their position. Go from right to left. The multiplication factor starts with 2 and is again set to 2 after the 8th position. The check digit is calculated from 11 minus the remaining value of the factor sum divided by 11.

The second check digit has to be calculated like mode 1.

Example: 612345

Factor sum: $5*2 + 4*3 + 3*4 + 2*5 + 1*6 + 6*7 = 92$

Modulo 11 $92 \text{ Modulo } 11 = 9 \text{ Rest } 4$

First check digit $11 - 4 = 7$

Second check digit according mode 1: **1**

Examples

89	EM	y	89	97	FC2	FC2	97	105	Start	Code	C
90	SUB	z	90	98	Shift	Shift	98	106	Stopp		

Usage

The code consist of minimum 4 units: start bar, message, check digit and the stop bar.

The start bar defines the code mode (A/B/C or Reference 103 to 105), in which the following data begin to be coded.

With the usage of additional **control signs** it is possible to change the mode within the message data. (Reference 100 to 102).

For code 128 the **characters to print** are calculated by adding 33 to the reference value. This makes it easy for code A and B, just add 1 to the ASCII-value of the message sign.

Examples: Code A character ' C ' is printed as <68> = 'D'
 Code B character ' c ' is printed as <100> = 'd'
 Code C number combination 99 is printed as <132>

Some Computer Systems as e.g. AS/400 have problems to send characters above ASCII 128. The fonts with the additional name HOST, type face number 11050 and 11051 do print all characters starting position 91, but moved down to starting position 41.

You may switch using Shift-In and Out between both fonts. Some examples are explained at chapter 2of5 interleaved.

The characters above 127 are also again implemented at position 200 and above within the same master fonts.

Check digit

The check digit is the **modulo 103** result of the addition of all reference values multiplied with their position.

Example: CODE 128:

Message	St.B	C	O	D	E	space	1	2	8
Reference value	104	35	47	36	37	0	17	18	24
Multiplicator	1	1	2	3	4	5	6	7	8
Sum	104	+ 35	+ 94	+ 108	+ 148	+ 0	+ 102	+ 126	+ 192
Check digit	= 909 Module 103 = 85 (reference digit)								

Example 1

Using CODE B to print: CODE 128

Message	St.B	C	O	D	E	space	1	2	8	check	end
Reference.	104	35	47	36	37	0	17	18	24	85	106
Print char.	137	68	80	69	70	33	50	51	57	118	139

The calculation of the check digit is shown in the above example.

Example 2

The message is: 1234Abc. The numbers are printed in compression mode C, the characters in mode B:

The check digit: 1349 modulo 103 = reference 10.

Message	St.C	12	34	C B	A	b	c	check	end
Reference	105	12	34	100	33	66	67	10	106
Multiplicator	1	1	2	3	4	5	6		
Check digit	105	12	68	300	132	330	402		
Print char.	138	45	67	133	66	99	100	43	139

Example 3: UPS Barcode

Message: 1Z645413530102336

Message	Reference	Print char.	UPS check digit	Code 128 check
Start B	104	137		104
1	17	50		$17 * 1 = 17$

6	22	55	6	$22 * 3 = 66$
4	20	53	+ 8	$20 * 4 = 80$
5	21	54	+ 5	$21 * 5 = 105$
4	20	53	+ 8	$20 * 6 = 120$
1	17	50	+ 1	$17 * 7 = 119$
3	19	52	+ 6	$19 * 8 = 152$
Co C	99	132		$99 * 9 = 891$
53	53	86	+ 5 + 6	$53 * 10 = 530$
01	01	34	+ 0 + 2	$1 * 11 = 11$
02	02	35	+ 0 + 4	$2 * 12 = 24$
33	33	66	+ 3 + 6	$33 * 13 = 429$
64	64	97	+ 6 = 66 -> 4	$64 * 14 = 896$
55	55	88		
Stop	106	139		

Code 128 check digit: $3660 \text{ modulo } 103 = 35 \text{ Rest } 55$

The detailed description of the code is available at any UPS office.

- Position 1-2 = FACT control ("1Z")
- Position 3-8 = UPS customer number
- Position 9-10 = Service code
- Position 11-17 = shipment number
- Position 18 = check sum

Service code: 53 = Standard collection, 54 = Express plus
 55 = Express, 56 = Standard.

UPC-128

The code 128 UPC Shipping Container is a numeric version of code 128 C with the fixed length of 10 digits. In addition to the regular modulo 103 check digit the code is enhanced with a module 10 check digit.

This result to the following structure:

Start C, FNC 1, [19 digits of numeric data], m10 check digit, modulo 103 check digit, Stop bar.

Modulo 10 check digit

All odd positioned digits are multiplied by 3 and the result is summed with the even positioned digits. The check digit is calculated by 10 minus sum modulo 10.

Valid characters

01..89 0 1 2 3 4 5 6 7 8 9

:: ; ; < < = = > >

Usage

This font is used in some countries for check printing.

Example

<27>(10U<27>)(s1p12vs3b10453T<1972675>0013< 0267> 0100027073;

<1972675>0013< 0267> 0100027073;

Important Note

This font was carefully developed, but it is not certified by the test authority. For certified fonts please replace this product with the JetMOBILE MICR SIMM/DIMM/MFC.

MICR Font**ESC-Sequence**

<27>(_<27>(s1p##vsb10453T

____ any symbol set, see User Reference Manual

Font size in point

Valid characters

0 1 . 8 9 0 1 2 3 4 5 6 7 8 9

A B ' C " D "

Usage

This font was carefully developed, but it is not certified by the test authority. For certified fonts and a even much more secure implementation, please have a closer look to the JetMobile MicrSIMM/ DIMM/MFC.

KIX Code

The KIX Barcode is used by the Netherlands post office. Please have a look in the KIX subdirectory of the sos8026 driver download disk. For addressing the font, see next Barcode

Singapore 4state KIX Code

ESC-Sequence

<27>(15Y<27>(s1p14.4vsb

Valid signs

numbers 01..89 and AB..YZ, start-sign ‘(’, stop-sign ‘)’

Usage

The start bar ‘(’ is followed by the user digits, the check sign and the stop bar ‘)’.

Check sum calculation

For all user characters of the code, calculate the Ascender sum. Then divide it by six and keep the remainder for the new Ascender Check sum.

Proceed the same calculation method with the Descender.

The check digit is the crossing of the Ascender and Descender remainders.

		Descender Value					
		1	2	3	4	5	0
Ascender Value	1	0	1	2	3	4	5
	2	6	7	8	9	A	B
	3	C	D	E	F	G	H
	4	I	J	K	L	M	N
	5	O	P	Q	R	S	T
	0	U	V	W	X	Y	Z

Example:

For the postal code “122346”:

A) Ascender Sum = $(1+1+1+1+1+2) = 7 \text{ \% } 6 = 1 \text{ Remainder } 1$

B) Descender Sum = $(2+3+3+4+5+1) = 18 \text{ \% } 6 = 3 \text{ Remainder } 0$

The check sum = 5

Addresses for further barcode information

Further written information for bar-coding could be requested at the following addresses:

- AIM: AIM USA, 634 Alpha Drive, Pittsburgh, PA 15238-2802, (412) 963-8588.
- Code 39: (ANSI MH10.8-1983, Chapter 4.4) American National Standards Institute (ANSI), Sales Dept., 1430 Broadway, NY, NY 10018, (212) 642-4900
- EAN: EAN International, Rue de Colonies 54,BTE 8, 1000 Bruxelles, Belgium, (02) 2187675
- JAN: Japan Industrial Standard Organization, The Distribution Code Center, No. 2 TOC-Bldg 7-23-1,Nishigotanda, Shinagawa-ku, Tokyo 141
- UPC: Uniform Product Code Council, Inc., 7051 Corporate Way, Suite 201, Dayton, OH 45459-4294, (513)435-3870.

Sos8026F Memory-Flash_Card

This product is equipped with about 10 MByte flash memory. Which can freely be used to store permanently forms into a printer as well as fonts, Logos and signatures?

For programming the modules you have the following 3 options:

- 1) Use WEB-JetAdmin, a free of charge tool from Hewlett-Packard., which should be found on your installation CD for the printer, no support form stethos!
- 2) www.stethos.com/e_Welp.htm, a free utility, which can download the forms to the printer. In order to work with it, you need to add a parameter – P7 , no support form stethos!

Macro (Form)

The sos8026 Version 1.1 and higher contains a macro or form. Printing this macro will result in sos8026 version statement.

Storing forms as macros into a printer will provide the following benefits:

- Significant reduction of data stream
- Faster printout of documents
- Security of „unchangeable“ forms
- Separation from data and form. This will prevent of reprinting old data on old forms, e.g. letters heads.

The driver download from www.stethos.com/-d_sos8026.htm provides the following test files for evaluation:

- VERSION.TXT (ASCII Format)
- WINWORD\FORMULAR.DOC

The macro is called through the following printer ESC-Sequence:

<27>&fs100y3x1S

Generally every application software is able to use automatic overlaid forms. There any PCL driver is needed. For SAP just define a new print control and call it an ABAB or SAPScript.

Note	The application will still have to position the variable data as it is doing right now.
------	---

For the implementation of additional fonts, forms or logos, you may choose out of the following methods:

1. Purchasing the sos8026 fonts as soft fonts in conjunction with an Euroform Flash SIMM/DIMM/MFC product.
2. Send any PCL print file on floppy to stethos Systemhaus GmbH® or one of the distribution addresses, listed on the next pages. For an additional fee we can implement your customization into the standard product.

VDA 4902 form

This form is added in it's third edition and is movable. The macro number 300 activates the form. The top left corner is printed at the actual cursor position. In order to print 2 forms on a A4 page in portrait, you need the following ESC-Sequences:

<27>&11E	Definition of top margin at column 1.
<27>&a0h0V	Set printer cursor top left
<27>&fs300y3x1S	Call macros 300
<27>&a0h4100V	Set cursor down to the lower half of page
<27>&fs300y3x1S	Call macro 300

English: Macro 301, French: Macro 302, Italien: Macro 303
 Spanish: Makro 304, Version 4: English: Macro 311, German: Macro 312

A complete print sample is stored on the driver download named VDA4902.TXT.

You will find the safety symbol  described on page 20. The barcodes are generated with 3of9 V1:2.5: <27>(10Q<27>(s1p17vs1b10006T. The space signs in the field Sach-Nummer have to be printed using the ,@' sign. If this conversion is cannot be made, you do need the JetMobile BarSIMM/DIMM/MFC!

sos8026 and SAP R/2 and R/3

OCR-A1 and OCR-B

For both fonts the sos8026 module is fully compatible to the JetMobile BarSIMM/DIMM/MFC and the Barcode & More cartridge, which are SAP certified. SAP supplies those PRINT-Controls in the HP LaserJet printer driver:

OCR-A	SF400	OCR-B	SF500
-------	-------	-------	-------

Barcodes

Because of the reasons, which are already explained on page 13, most barcodes of the sos8026 module are not able to be used from SAP applications. However, the following barcodes can be used:

Code 3of9	Codabar	Code 2of5 matrix
Code 2of5 industrial		
Code 2of5 interleaved (See on the driver download from www.stethos.com/-d_sos8026.htm , directory SAP)		

You need to define your own print controls for selection and de-selection. The selection sequence must end with the start sign, and the de-selection sequence must start with the stop sign. Example for Code 3of9:

Selection sequence:	<27>(10Q><27>(s1p20vsb10000T*
De-selection sequence:	*<27>(0N<28>(sp10hsb4099T

Another example can be found on the same SAP directory.

How to define a Print-Control using the German version of SAP R/3: Tools->Administration, Spool->Spool-Administration, Print-Control for device types, Change, HP LaserJet 4, insert Print-Control R/4: CCMS, Spool Administration, Output device types, HP Laser, „Hilfsmittel“, Print-Control.

Notes: You may have in the future the need to print some of the others barcodes. That is why we do recommend in stead of the sos8026 module the JetMOBILE BarSIMM/DIMM/MFC www.stethos.com/e_jetmobile.htm or the software emulation www.stethos.com/e_welp.htm!

Well, for the most used code 3of9 the sos8026 module is quite similar to the BarSIMM/DIMM/MFC.

Trouble shooting?

The printer doesn't print barcode:

1. Is the module correct installed? Generate a PCL font list print out and verify if the module is recognized in the slot.
2. Copy one of the demo print out files of the driver download from www.stethos.com/-d_sos8026.htm to the printer. Don't load it into MS Windows applications.

If this all do work, and your application still doesn't print the barcode, verify again the ESC-Sequence. It should start with the <ESC> sign and end with an uppercase 'T'. The barcode data should directly follow after this termination character.

Another good way to start the search is to replace the <ESC> by any printable characters. The printer must print now the sequence as readable text. If not, then the sequence is definitively not received by the printer.

How to stop barcode printing:

Just send any other font selection sequence after the barcode message. Example: For Courier 12 pt in PC850 symbol set use: <28>(12U<27>(sp10hsb4099T.

The barcodes of the PCL font list are not readable:

The printer does print only some characters as an example for the font style of the PCL font list. There for the barcode format like start/stop signs and check sums are missing! However the correct font esc sequences are printed.

LJ 4P and Color LaserJet 5: Please call stethos for further help.

The space problem:

The alpha numerical barcodes are able to define also a stroke/space set for the space sign. This sign is unfortunately the only unprintable sign for HP laser printers. The sos8026 module does have the space sign codes for those fonts at the character '@'. If you are not able to convert your barcode data, you should use the JetMobile BarSIMM/DIMM/MFC www.stethos.com/e_jetmobile.htm or the software emulation www.stethos.com/e_welp.htm.

2of5 interleaved and Code 128 on Color LaserJet 8500 and 8550

Those two types of barcode are not supported on this printers

LJ 2200 Typeface list

Some Hebrew fonts are listed instead of the names with barcodes. This doesn't effect the printing of those fonts.

Additional Products

Further information to the following products are available via Internet. The URL-Address of stethos is listed on the next page.

- sos8026K This product is compatible to **sos8026S/C/D/F**. The cartridge is suitable in the following HP laser printer:
Series III, IIID, IIIP, IIISi, 4, 4M, 4 Plus, 4M Plus, 4P, 4Si and 4Si Mx.
- Flash-SIMM The HP Flash-SIMM realizes the permanent storage of forms, graphics and fonts in the printer. All in this documentation described barcodes and fonts are available in consumption with a Flash-SIMM as soft fonts.
- BarDIMM The JetMobile® BarSIMM/DIMM/MFC is a firmware enhancement for HP laser printers series 4 and newer (not L- and ML-Versions). The Module realizes about 40 in X- and Y-direction free scaleable barcodes. Check digits and the „Interleaving“ is done by the printer. Some software packages like KHK or SAP for realization of barcode printing this product. The ESC-Sequence maybe up to 39 characters.
www.stethos.com/e_jetmobile.htm.

Barcodes for Windows

Special MS Windows solution based on TrueType fonts. The attached software do work on all Windows versions and is responsible for all calculations. The result is copied to the clipboard and can be pasted into nearly all applications. The easy to handle DDE interface of the program realizes data communication between your DDE capable application and the software. For example, it will take only view minutes to do mail merging with Word for Windows, including printing data base fields in barcode format. Barcodes without check digits and „Interleaving“ are suitable in connection with the TrueType fonts without the attached software.
www.stethos.com/e_barwin.htm

- W-ELP: An integrated output management system on various platforms (AS400/Linux/Unix/AIX/Wndows etc..) with a quite number of functions like:
- intelligent Barcode
 - integrated forms and printer handling
 - Distributed printing and archiving incl. reprinting and eMail

- OMR barcode and postal optimization
- Various Emulation, PDF, TIFF, CALS; PPDM etc.

Barcode Reader

All listed types of readers are available for keyboard and serial connectivity and portable solutions. The data can be transferred via cable, infrared and bi-directional radio controlled communication. The fully portable systems are also available programmable for your own functionality and with voice control.

Pen readers for easy contact scanning.

CCD Scanner Contact or distance scanner with reading width of 6, 8 and more cm.

Laser scanner Distance scanner beginning of about 15 cm up to several meters with high scanning frequency.

Portable Systems

All above named readers are available for portable systems.

HP OCR + Barcode

**SIMM sos8026S or
DIMM sos8026C/L/D or
MF-Card sos8026F or
Cartridge sos8026K**

provides the following functionality:

- OCR-A1 and OCR-B free scaleable
- All barcodes, OCR and Line Draw fonts of the „Bar Codes & More C2053A#C06” font cartridge
- Scalable Barcodes: Code 39 (Code 3aus9) and 39 extended, 2aus5 interleaved, 2aus5 industrial, 2aus5 matrix, Code 128 A/B/C, UCC-128, EAN 8/13/128, UPC-A, UPC-E 0 und 1, EAN/UPC Addon 2, EAN/UPC Addon 5, EAN Velocity, MSI, Leit- und Identcode der Deutschen Post AG, Code 93 und 93 extended, Codabar
- Printing readable text is optional possible (except Code 128)
- KIX Barcode for the Netherlands Post Office
- For Check-Printing: Micro font, CMC7 and OCR-A1
- Scaleable symbols like broken glass, green point, **Fehler! Keine Indexeinträge gefunden.**explosive, recycling, dead head and much more
- VDA 4902 form in 5 different languages
- A test form
- MFC product is able to store permanent forms, logos fonts etc.

Developed and produced by stethos Systemhaus GmbH®.
Distribution: All companies listed in technical support chapter
